

How the agent operates

```
python3 -m chkpmcpaz chat "how many hosts are configured?"
```

- 1 You ask a plain-English question about the estate.
- 2 Optional guardrail screens the input before any model call (Lakera or Prompt Shields).
- 3 The agent spawns @chkp stdio children and merges their tools/list as server__tool.
- 4 The provider formats tools; Claude or gpt-5-mini picks a tool + args, streaming.
- 5 ServerPool calls the tool; the truncated result (is_error) feeds back and the loop repeats.
- 6 You get an answer grounded in real tool output — not a guess.

tokens 12,345 in · 890 out · 11,200 cache-read · 91% of input from cache

The same loop runs in your terminal (`--runtime local`) or on a Foundry Hosted Agent (`--runtime hosted, chkpmcp-agent`); with `--session`, the hosted runtime keeps platform-managed conversation history.
